

Dear Mr Dear Ms!

I saw that in the week of November 23-27, 2020 the Fridays for Future project "Open Your Course 4 Climate Crisis" (OC4CC) will take place for the second time. The project aims to show the breadth of the problem by combining different teaching contents with the climate crisis. Lecturers and teachers will examine the climate crisis in their lessons from a wide variety of perspectives.

I would be very interested in how the climate crisis is affecting your area of expertise. Perhaps you could take some minutes in the week of March 23-27. November to answer some of the following questions?

* To what extent do you notice that the climate crisis is causing changes or rethinking in your field?

* Solving the climate crisis is a task for society as a whole, what can your department contribute to a transition to a sustainable society?

* Which strategies / facts are known in your area of expertise and should be generally known in order to solve the climate crisis?

* In connection with the climate crisis, the call for scientists from all departments to participate in political decision-making processes is getting louder, how can your department contribute?

However, I would be particularly interested in your personal view of the topic, so if you have your own ideas on how to connect your subject with the climate crisis, then you see these questions as invalid!

Here you can easily register to participate: ffutu.re/oc4cc-mitmachen

Thank you very much in advance and best regards,
